

## **Task 3: Corporate Sales and Performance Analytics Tracker**

### **Power BI Internship Project Report**

**Prepared by: Tayyaba Awan**

#### **1. Introduction**

The Corporate Sales & Performance Analytics Tracker is an interactive business intelligence dashboard developed using Microsoft Power BI. The purpose of this project is to analyze corporate sales performance and distribution KPIs through interactive visualizations, DAX-based calculations, slicers, trend analysis, product performance charts, and matrix tables.

The dashboard transforms sales data into meaningful business insights and provides users with an easy-to-use interface for monitoring sales performance.

#### **2. Project Objective**

The main objective of this project is to develop an interactive corporate analytics dashboard that can:

- Monitor overall sales performance.
- Analyze sales trends over time.
- Calculate Year-over-Year (YoY) growth.
- Calculate Year-to-Date (YTD) sales.
- Analyze moving averages.
- Compare sales performance across regions.
- Analyze department-level performance.
- Compare product sales performance.
- Provide interactive filtering using slicers.
- Present detailed information through a matrix table.
- Support data-driven business decision-making.

#### **3. Tools and Technologies Used**

The following tools and technologies were used:

- Microsoft Power BI
- Power Query
- DAX (Data Analysis Expressions)

- Data Modeling
- Data Visualization
- Business Intelligence

#### **4. Dashboard Development**

The dashboard was developed in Microsoft Power BI. The data was prepared and modeled before creating the final visualizations.

The dashboard was designed with a professional and user-friendly layout containing KPI cards, interactive slicers, trend graphs, product performance charts, and a matrix table.

#### **5. Interactive Slicers**

Four interactive slicers were added to the dashboard:

1. Year
2. Region
3. Department
4. Product

These slicers allow users to dynamically filter the dashboard and analyze specific portions of the sales data.

For example, users can select a particular year, region, department, or product to view the corresponding sales performance.

#### **6. KPI Metrics**

Several important KPI metrics were developed using DAX.

##### **6.1 Total Sales**

The Total Sales measure calculates the overall sales amount available in the dataset.

##### **6.2 Year-to-Date Sales**

The YTD measure calculates the total sales from the beginning of the selected year up to the selected date.

This metric helps monitor current-year's sales performance.

##### **6.3 Year-over-Year Growth**

The YoY Growth metric compares the current sales performance with the previous year's performance.

It helps identify whether sales have increased or decreased compared with the previous year.

## **6.4 Moving Average**

The Moving Average metric smooths sales fluctuations and helps identify the underlying sales trend over time.

## **7. Dashboard Visualizations**

### **7.1 KPI Cards**

KPI cards were used to display important business metrics in a simple and easily understandable format.

The dashboard includes:

- Total Sales
- YTD Sales
- YoY Growth
- Moving Average

### **7.2 Sales Trend Graph**

A sales trend graph was created to visualize changes in sales over time.

This visualization helps users identify:

- Increasing sales trends
- Decreasing sales trends
- Sales fluctuations
- Overall performance patterns

### **7.3 Product Sales Performance**

A clustered bar chart was created to compare sales performance across different products.

The products were sorted by Total Sales in descending order, making it easier to identify the highest-performing products.

### **7.4 Matrix Table**

A matrix table was developed to provide detailed sales performance analysis by region and department.

The matrix allows users to compare different business segments and understand how sales are distributed across regions and departments.

## **8. Dashboard Layout**

The dashboard was organized into different sections to improve readability and usability.

The general structure includes:

- Dashboard title at the top
- Interactive slicers below the title
- KPI cards for important metrics
- Sales trend visualization
- Product performance chart
- Matrix table for detailed analysis

This layout provides a clear flow from high-level KPIs to detailed performance analysis.

## **9. Data Analysis and Business Insights**

The dashboard can be used to identify several important business insights, including:

- Overall corporate sales performance.
- Sales growth compared with previous years.
- Current-year sales performance.
- Sales trends over time.
- High-performing products.
- Low-performing products.
- Regional differences in sales.
- Department-level sales performance.

These insights can help organizations identify performance patterns and make better business decisions.

## **10. Professional Formatting**

Professional formatting was applied to improve the appearance and usability of the dashboard.

The following formatting elements were implemented:

- Clear dashboard title
- Organized KPI cards

- Consistent visual layout
- Clear chart titles
- Readable labels
- Proper alignment of visuals
- Structured matrix table
- Organized slicers

The objective was to make the dashboard visually appealing while keeping the information easy to understand.

## **11. Results**

The final Power BI dashboard successfully provides an interactive environment for analyzing corporate sales performance.

Users can:

- Filter the dashboard using slicers.
- Monitor important KPIs.
- Analyze sales trends.
- Compare product performance.
- Review of regional and departmental performance.
- Analyze YoY growth.
- Monitor YTD sales.
- Evaluate moving averages.

The dashboard therefore fulfills the primary objective of creating an interactive corporate sales and performance analytics tracker.

## **12. Conclusion**

The Corporate Sales & Performance Analytics Tracker demonstrates the use of Power BI for business intelligence and sales analysis.

Through DAX calculations, interactive slicers, KPI cards, trend graphs, product performance charts, and matrix tables, raw sales data was transformed into a meaningful and interactive analytical dashboard.

This project provided practical experience in Power BI, DAX, data visualization, dashboard design, and business performance analysis.

### **13. Future Improvements**

The dashboard can be further enhanced by adding:

- More advanced drill-through pages.
- Additional business KPIs.
- Detailed regional dashboards.
- Automated data refresh.
- Advanced forecasting.
- More advanced cascading filter behavior.
- Additional comparative analytics.

### **14. Project Deliverables**

The project deliverables include:

- Power BI .pbix dashboard file
- Dashboard screenshot
- GitHub repository
- Project documentation / README
- Project report
